Coding & Solution

This section evaluates the quality and completeness of the implemented code and the overall solution.

Instructions:

Ensure the code is structured, documented where necessary, aligned with requirements, and includes source files, configuration, setup instructions, and repository details.

Solution Summary

Field	Details
Repository Link / URL	https://github.com/shrijadwivedi-web/Personalised-Networking-Assistant
Programming Language(s)	Python
Framework(s) Used	FastAPI backend, Streamlit frontend, SQLAlchemy ORM, pytest, Docker Compose
Key Features Implemented	User registration/login, JWT-protected routes, profile personalization, event theme extraction, personalized conversation starters, tone control, confidence scoring, fact checking, history, feedback, rate limiting, and resilient errors.
Pending / Incomplete Features	No verified public deployment, SQLite is local/small-scale, no migrations, limited production observability, external AI requires GEMINI_API_KEY, and load testing is limited.
Setup / Run Instructions	Create venv; pip install -r requirements.txt; copy .env.example to .env; set GEMINI_API_KEY for generation; run uvicorn app.main:app --reload; run streamlit run frontend/app.py. Optional: docker compose up --build.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

The implemented solution is a working local web application with a tested FastAPI API, Streamlit UI, database-backed user data, and Docker support. Automated tests cover authentication, protected routes, profile updates, feedback/history persistence, service behavior, and error handling. Production readiness is limited by local SQLite defaults, no verified public deployment, no migration tooling, limited observability, and dependency on an external Gemini API key for conversation generation.
