

Project Executable Files

Date	7 July 2026
Team ID	
Project Name	Personal Network Assistant
Maximum Marks	3 Marks

Project Executable Files

This section provides the executable, deployable, and runnable files for the Personal Network Assistant project. The repository contains source code, setup files, tests, Docker configuration, and documentation needed to run the application locally.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (including run instructions)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files	Yes
5	Environment configuration file	Yes
6	Deployed application URL	No
7	APK / Executable binary	NA
8	Dockerfile / Containerization configuration	Yes
9	Test files and test results	Yes
10	Demo video or walkthrough	No

Step 2: File / Folder Structure

```

Personalised-Networking-Assistant-main/
  README.md
  .env.example
  requirements.txt
  requirements-frontend.txt
  requirements-test.txt
  Dockerfile.backend
  Dockerfile.frontend
  docker-compose.yml
  app/
    main.py, auth.py, database.py, db_models.py, models.py
    routes/auth.py, routes/conversation.py
    services/event_analyzer.py, topic_generator.py, fact_checker.py
    services/history_logger.py, feedback_logger.py, profile_service.py, scorer.py
  frontend/
    app.py, common.py
    pages/1_Profile.py, 2_Fact_Check.py, 3_History.py, 4_Feedback.py
  tests/
    API, auth, security, error-handling, services, persistence tests
    performance/locustfile.py
  Documentation/
    Project phase documentation, testing evidence, generated PDFs
  data/
    app.db created automatically at runtime
  
```

Step 3: Deployment / Access Details

Hosted / Deployed URL	Not deployed publicly
Login Credentials (Demo)	Not provided. Locust test users are generated dynamically during performance tests.
Platform / Hosting Provider	Local environment / Docker Compose
Repository Link	https://github.com/shrijadwivedi-web/Personalised-Networking-Assistant
Demo Video Link	Not provided

Step 4: Run Instructions

Prerequisites: Git, Python 3.10+ (3.11 recommended), pip, and optionally Docker Desktop.

Windows PowerShell setup:

```
git clone https://github.com/shrijadwivedi-web/Personalised-Networking-Assistant.git
cd Personalised-Networking-Assistant
python -m venv venv
.\venv\Scripts\Activate.ps1
python -m pip install --upgrade pip
pip install -r requirements.txt
Copy-Item .env.example .env
```

Edit .env before using conversation generation:

```
SECRET_KEY=<random local secret>
GEMINI_API_KEY=<your Google Gemini API key>
GEMINI_MODEL=gemini-2.5-flash
DATABASE_URL=sqlite:///./data/app.db
```

Terminal 1 - FastAPI backend:

```
uvicorn app.main:app --reload
API: http://127.0.0.1:8000
Swagger docs: http://127.0.0.1:8000/docs
```

Terminal 2 - Streamlit frontend:

```
streamlit run frontend/app.py
Frontend: http://localhost:8501
```

Database behavior: app startup calls init_db() and creates SQLite tables automatically at data/app.db if they do not exist.

Optional Docker Compose:

```
docker compose up --build
Frontend: http://localhost:8501
Backend: http://localhost:8000
Stop: docker compose down
```

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Conversation generation requires network access and a valid GEMINI_API_KEY.	Set GEMINI_API_KEY in .env; other features still run without it.
2	SQLite is best suited to local or small single-instance usage.	DATABASE_URL can be changed for a server database such as PostgreSQL.
3	No verified public deployment or demo video is present.	Run locally with PowerShell commands or Docker Compose.
